

# EXHIBIT J

**U.S. Patent No. 8,631,450 (“the ’450 Patent”) Exemplary Infringement Chart**

The Accused MoCA Instrumentalities are instrumentalities that DISH deploys to provide a whole-premises DVR network over an on-premises coaxial cable network, with DISH “Hopper” and “Joey” nodes operating with data connections compliant with MoCA 1.0, 1.1, and/or 2.0. The Accused MoCA Instrumentalities include the DISH Hopper, DISH Hopper with Sling, DISH Hopper DUO, DISH Joey, DISH Joey 2, and DISH Super Joey, DISH Hopper 3, DISH 4K Joey, and DISH Joey 3, and substantially similar instrumentalities. DISH literally and/or under the doctrine of equivalents infringes the claims of the ’450 Patent under 35 U.S.C. § 271(a) by using the Accused MoCA Instrumentalities.

| <b>U.S. Patent No. 8,631,450</b>  | <b>The Accused MoCA Instrumentalities Form a Network That Practices at Least Claim 29 of the ’450 Patent</b>   |

| 29. A broadcasting method within a Broadband Coaxial Network (“BCN”), comprising: | <p>The Accused Services are provided using at least the Accused MoCA Instrumentalities including the DISH Hopper, DISH Hopper with Sling, DISH Hopper DUO, DISH Joey, DISH Joey 2, DISH Super Joey, DISH Hopper 3, DISH 4K Joey, and DISH Joey 3, and devices that operate in a similar manner. The Accused MoCA Instrumentalities operate to form a broadband coaxial network over an on-premises coaxial cable network as described below.</p> <p>The DISH full-premises DVR network constitutes a broadband coaxial network as claimed. The DISH full-premises DVR network is a MoCA network created between at least one Hopper DVR and one or more Joey receivers using the on-premises coaxial cable network. This MoCA network is compliant with MoCA 1.0, 1.1, and/or 2.0.</p> <p>“The MoCA system network model creates a coax network which supports communications between a convergence layer in one MoCA node to the corresponding convergence layer in another MoCA node.”<br/>(MoCA 1.0, Section 1. <i>See also</i> MoCA 1.1, Section 1.1; MoCA 2.0, Section 1.2.2)</p> |

| U.S. Patent No. 8,631,450 | The Accused MoCA Instrumentalities Form a Network That Practices at Least Claim 29 of the '450 Patent   |
|---------------------------|---|
|                           | <p>“The MoCA Network transmits high speed multimedia data over the in-home coaxial cable infrastructure.”<br/> (MoCA 1.0, Section 2. <i>See also</i> MoCA 1.1, Section 2; MoCA 2.0, Section 5)</p> <p>“In addition to the point-to-point communication, the MoCA protocol supports broadcast and multicast capabilities. When transmitting to multiple devices, a node must find a set of PHY parameters that all the other nodes can receive. Even though two links from a given transmitter may have the same channel capacity, their individual link characteristics may be drastically different. A common set of PHY parameters that both receive nodes can receive may have less capacity. For broadcast and multicast transmissions, a node must calculate a Broadcast Bitloading (BBL) profile for all nodes that may receive the packet from this node.”<br/> (MoCA 1.0, Section 2.1.2. <i>See also</i> MoCA 1.1, Section 2.1.2, MoCA 2.0, Section 5.3.1)</p> <p>DISH utilizes the MoCA standard to provide an on-premises DVR network over an on-premises coaxial cable network as described below:</p> |

|---------------------------|---|
|                           | <p>includes 16 satellite tuners and a 2TB hard drive.</p> <p>JOEY: The Joey is the MoCA thin-client receiver that networks with the Hopper for viewing on additional TVs.</p> <p>4K JOEY: The 4K Joey is an option for installation on additional 4K TVs.</p> <p>DISH PRO HYBRID 42 SWITCH: This switch allows two Hopper 3 DVRs to be installed using a single DISH traditional 1000.2 antenna. Each Hopper 3 forms its own MoCA video network with connected Joeys. The switch comes with a 110VAC power supply unit.</p> <p>Your new Hopper® 3 receiver is a Whole-Home HD DVR that offers full digital video recording functionality, including pausing live TV, to every TV in your house that is part of your Whole-Home DVR system. The Hopper 3 receiver is the hub for all things entertainment. It is an HD DVR that provides the equivalent of 16 tuners, allowing you to record multiple HD channels at once and at any time and play them back in any room in your home. Using the PrimeTime Anytime® feature, you can record up to six HD channels simultaneously (with your local ABC, CBS, FOX and NBC channels provided in HD, which may not be available in all markets). It is one HD DVR that works independently on as many as four different TVs at the same time, so everyone can be in different room watching their favorite TV programming.</p> <p>Joey® receivers (Joey®, SuperJoey®, Wireless Joey®, 4K Joey™) connect to other TVs in your home and link to the Hopper 3 system, creating a Whole-Home DVR network. It supports all of the features of the Hopper 3 (with the exception of Picture-In-Picture) and offers an identical user interface as the Hopper 3. You can connect a Joey receiver to a high-definition or standard-definition TV.</p> |

|--|---|
| a transmitting node transmitting a probe signal to a plurality of receiving nodes; | <p>The Accused MoCA Instrumentalities include a transmitting node transmitting a probe signal to a plurality of receiving nodes as described below.</p> <p>For example, by virtue of their compliance with MoCA, the Accused MoCA Instrumentalities include circuitry and/or associated software modules constituting a transmitting node transmitting a probe signal to a plurality of receiving nodes.</p> <p>“While it is physically a shared medium, the logical network model is a fully meshed collection of point-to-point links, each with its own unique channel characteristics and channel capacity. MoCA devices use optimized PHY parameters between every point to point link. Each set of optimized PHY parameters is called a PHY Profile. Because each link is unique, it is critical that all nodes know the source and the destination for every transmission.”</p> <p>(MoCA 1.0, Section 2.1.2. <i>See also</i> MoCA 1.1, Section 2.1.2; MoCA 2.0, Section 1.2.2)</p> <p>“A variety of physical layer frequency-domain and time-domain probes are used to create modulation profiles, optimize performance, and allow for various calibration mechanisms. Type I Modulation Profile Probes are frequency domain probes used to determine modulation profiles of the channel between any two nodes. Type II Probes are frequency domain probes consisting of two tones that may be used to fine tune performance. A Type III Echo Profile Probe may be used to determine the impulse response of the channel. This information can be used to optimize various physical layer parameters. In addition to the above probes, this specification provides opportunities for various unique Loopback Transmissions which may be useful for RF calibration, among other things.”</p> <p>(MoCA 1.0, Section 2.2. <i>See also</i> MoCA 1.1, Section 2.2; MoCA 2.0, Section 5.2)</p> |

|---------------------------|--|
|                           | <p>“LMO is the process by which MoCA nodes periodically update transmit power levels and PHY profiles. The LMO operation MUST be performed as follows:<br/> (1) NC selects a node to be the “LMO node”,<br/> (2) All nodes participate in the signal exchanges specified in this section for completing LMO of the LMO node.<br/> (3) NC selects the next node for LMO and the process is repeated.”<br/> (MoCA 1.0, Section 3.7. <i>See also</i> MoCA 1.1, Section 3.7; MoCA 2.0, Section 8.9)</p> <p>“The NC MUST indicate the beginning of the LMO signal exchange for a node by indicating the Link Control State “Type III Probe” (LINK_STATE = 0x07) and by setting LMO_NODE field of asynchronous MAPs to the Node ID of the LMO Node. The LMO_DESTINATION_NODE should always be set to 0x3F. Subsequently, all nodes MUST follow signal exchanges defined in this section.”<br/> (MoCA 1.0, Section 3.7. <i>See also</i> MoCA 1.1, Section 3.7; MoCA 2.0, Section 8.9)</p> <p>“As shown in Figure 3-11, the first state for the LMO of a node is the Type III Probe State. In this Link Control state, the LMO node transmits Type III Probes to all other nodes and receives reports back from them. This state is followed by the LMO Type I Probe state. In this Link Control state, the LMO node transmits Type I Probes to all other nodes and receives Type I Probe Reports back from them. The next Link Control state is the LMO GCD Distribution state. In this state, the LMO node sends the newly computed GCD PHY Profile to all other nodes and receives acknowledgements back from them. The next Link Control state is the Begin LMO PHY Profile state. The LMO node can begin using its new PHY Profile after the NC indicates this state in asynchronous MAPs.”<br/> (MoCA 1.0, Section 3.7.1. <i>See also</i> MoCA 1.1, Section 3.7.1; MoCA 2.0, Section</p> |

|  | <p>(MoCA 1.0, Figure 3-11. See also MoCA 1.1, Figure 3-14; MoCA 2.0, Section 8.9)</p> <p>“Probe – A signal transmitted by a MoCA node and received by the same or another node for improving or maintaining PHY performance of inter-node links.”<br/>(MoCA 1.0, Section 1.2. See also MoCA 1.1, Section 1.2, MoCA 2.0, Section 3)</p> <p>“The MoCA physical layer (PHY) utilizes a modulation technique named Adaptive Constellation Multi-tone (ACMT). ACMT is a variation of orthogonal frequency division multiplexing (OFDM) where knowledge of the channel is used to pre-equalize all signals using variable bitloading on all subcarriers. The term used to describe the bitloading of the ACMT subcarriers is “modulation profile” and the process of creating a modulation profile between a node pair is called “modulation profiling”. During periodic modulation profiling, probes are sent between all nodes and analyzed. After probe analysis, modulation profiles are chosen to optimize individual link throughput while maintaining a low packet error rate (PER). For each active ACMT subcarrier, the QAM constellation can vary from 1 to 8 bits per symbol (BPSK through 256QAM). Individual subcarriers can also be turned off. As a result, the number of bits per ACMT symbol varies as a function of the channel path.”<br/>(MoCA 1.0, Section 2.2. See also MoCA 1.1, Section 2.2; MoCA 2.0, Section 5)</p> |
| the transmitting node receiving a plurality of response signals comprising a plurality of bit-loading modulation schemes from the plurality of receiving nodes, wherein each of the plurality of receiving nodes | <p>The Accused MoCA Instrumentalities include the transmitting node receiving a plurality of response signals comprising a plurality of bit-loading modulation schemes from the plurality of receiving nodes, wherein each of the plurality of receiving nodes as described below.</p> <p>For example, by virtue of their compliance with MoCA, the Accused MoCA Instrumentalities include circuitry and/or associated software modules that receive a plurality of response signals comprising a plurality of bit-loading modulation</p>   |

| PREAMBLE_TYPE  | Preamble Type P3 or P4 (see Section 4.4.2). Selection is based on channel conditions. For MAP elements, this field is Reserved.  |           |             |               |   |                      |   |                |   |           |  |                   |                                  |                   |                                  |        |                    |
| BITS_PER_ACMT_SYMBOL   | The total number of bits per ACMT symbol, calculated from the Modulation Profile.  |           |             |               |   |                      |   |                |   |           |  |                   |                                  |                   |                                  |        |                    |
| CHANNEL_USABLE   | Defines if the bandwidth passes the Admission Limit (Section 8.1.5) during Admission or Minimum Link Throughput (Section 8.1.6) during LMO.  |           |             |               |   |                      |   |                |   |           |  |                   |                                  |                   |                                  |        |                    |
| CP_LENGTH  | Cyclic Prefix length to be used in future unicast transmissions. May also used to calculate the CP length for GCD transmissions.   |           |             |               |   |                      |   |                |   |           |  |                   |                                  |                   |                                  |        |                    |
| TPC_BACKOFF_MAJOR  | Outer Loop Power Control backoff   |           |             |               |   |                      |   |                |   |           |  |                   |                                  |                   |                                  |        |                    |
| TPC_BACKOFF_MINOR  | Outer Loop Power Control backoff   |           |             |               |   |                      |   |                |   |           |  |                   |                                  |                   |                                  |        |                    |
| SC_MOD   | Modulation Profile   |           |             |               |   |                      |   |                |   |           |  |                   |                                  |                   |                                  |        |                    |

| <p>determine a common bit-loading modulation scheme; and</p> | <p>as described below.</p> <p>For example, by virtue of their compliance with MoCA, the Accused MoCA Instrumentalities include circuitry and/or associated software modules that compare the plurality of bit-loading modulation schemes to determine a common bit-loading modulation scheme.</p> <p>“The topology of the in-home coax typically results in a multi-path delay profile. Because the echoes can be stronger and/or weaker than the original signal, depending on the output port-to-output port isolation of the jumped splitter, the channel is said to have either pre- or post-echoes, respectively. A zero decibel echo, i.e., equal power to the main path, leads to deep nulls in the frequency domain spectrum. In order to achieve target packet error rates of less than 10<sup>-5</sup> for large packets (&gt;1500 bytes) with no retransmissions, the MoCA physical layer uses channel pre-equalization (using bit loading) and multi-tone modulation on all links.”<br/>(MoCA 1.0, Section 2.2. <i>See also</i> MoCA 1.1, Section 2.2; MoCA 2.0, Section 5.2)</p> <p>“ACMT is a variation of orthogonal frequency division multiplexing (OFDM) where knowledge of the channel is used to pre-equalize all signals using variable bitloading on all subcarriers. The term used to describe the bitloading of the ACMT subcarriers is “modulation profile” and the process of creating a modulation profile between a node pair is called “modulation profiling”. During periodic modulation profiling, probes are sent between all nodes and analyzed. After probe analysis, modulation profiles are chosen to optimize individual link throughput while maintaining a low packet error rate.”<br/>(MoCA 1.0, Section 2.2. <i>See also</i> MoCA 1.1, Section 2.2; MoCA 2.0, Section 5)</p> |
